Obtaining a representative and uncontaminated sample of the fluid to be analyzed (lube oil, fuel

oil, solvent) is the first key step of a proper used oil monitoring and machinery predictive maintenance program.

When the oil sample is not truly representative of the oil state, the test result may be biased and the test interpretation compromised.

Housed in a rugged and lightweight case designed for field use, the GESERCO sampling kits and solutions include everything you need to easily draw, preserve and document a representative and uncontaminated sample.
